## ■ ABSTRACT

*Purpose:* The present study was designed to investigate the effects of Tween excipients (polysorbates; Tween 20, Tween 40 and Tween 80) on the activity and expression of P-glycoprotein (P-gp). *Methods:* An MTT assay test was conducted to determine the non-toxic concentration of the excipients. Moreover, the uptake of Rhodamine-123, a P-gp fluorescence substrate, was measured through Caco-2 cell monolayer encountering with excipients overnight to investigate whether sub-toxic concentrations of Tween excipients are able to affect the P-gp activity. Furthermore, Western blotting was performed to investigate the P-gp protein expression. *Results:* The results showed that Tween 20 and Tween 80 at concentrations below 0.01 % (w/v), and Tween 40 at concentrations below 0.05 % (w/v) were non-toxic to Caco-2 cells. Results from the Rhodamine-123 uptake test assay and Western blotting showed that Tween 20 at concentration of 0.01 % (w/v) and Tween 40 at concentration of 0.05 % (w/v) were able to block P-gp significantly. *Conclusion:* Based on the obtained results it is concluded that Tween excipients at the defined concentrations could be used to inhibit the P-gp efflux transporter resulting in an altered bioavailability of drugs.

---

## ■ ZUSAMMENFASSUNG

---

### **Der Effekt von Tween Hilfsstoffen auf die Aktivität und Expression von P-Glycoprotein in Caco-2- Zellen**

*Ziel:* In dieser Arbeit wurde der Effekt von Tween Hilfsstoffen (Tween 20, Tween 40, Tween 80) auf die Aktivität und Expression von P-Glycoprotein (P-GP) untersucht. *Methoden:* Ein MTT Untersuchungstest wurde durchgeführt um die nicht-toxische Konzentration von Hilfsstoffen zu ermitteln. Ferner wurde die Aufnahme von Rhodamin-123, ein P-GP Fluoreszenzsubstrat, gemessen, indem Caco-2-Monolayer-Zellen über Nacht den Hilfsstoffen ausgesetzt wurden. Dabei wurde untersucht, ob die subtoxischen Konzentrationen von Tween Hilfsstoffen die Aktivität von P-GP beeinflussen können. Daraufhin wurde die Western Blot-Methode durchgeführt, um die Proteinexpression von P-GP zu untersuchen. *Ergebnisse und Diskussion:* Die Ergebnisse zeigen, dass Tween 20 und Tween 80 bei Konzentrationen unter 0.01 % (w/v), und Tween 40 bei Konzentrationen unter 0.05 % (w/v) eine nichttoxische Wirkung auf Caco-2-Zellen haben. Die Ergebnisse von Rhodamin-123-Aufnahmen und der Western Blot-Methode zeigen, dass Tween 20 bei einer Konzentration von 0.01 % (w/v) und Tween 40 bei einer Konzentration von 0.05 % (w/v) P-GP erheblich blockieren können. *Fazit:* Anhand der erreichten Ergebnisse ist festzustellen, dass Tween Hilfsstoffe in bestimmten Konzentrationen angewendet werden können, um den Efflux-Transporter P-GP zu blockieren, und damit die Bioverfügbarkeit von Arzneistoffen zu verändern.

## 1. Introduction

---

Having many advantages, like enhanced patient compliance and easier chronic administration, 85 % of drugs sold around the world are administered orally. Oral delivery is the most preferred route in drug prescription but, unfortunately, nearly 50 % of orally administrated drugs have low bioavailability (BA) due to their poor and inadequate absorption through the intestinal mucosa [1, 2]. Active efflux of drugs into the gastrointestinal (GI) lumen is generally recognized as a factor for limiting drug absorption and it is responsible for variability in plasma drug concentrations [3].

An efflux pump, P-glycoprotein (P-gp), which has been known to be over-expressed in tumor cells [4], is highly expressed in almost all endothelial tissues and is the most representative in the group of efflux transporters in controlling the drug disposition [4-9]. P-gp, encoded by the multidrug resistance (MDR1) gene in humans, is a 170 kD integral membrane protein associated with the transport of several hydrophobic, amphipathic, cationic and neutral molecules [10] with a molecular weight ( $M_w$ ) of 200-300

125 Da [11]. It is expressed in the apical surface of epithelial  
126 cells in many tissues of the human body such as mature  
127 enterocytes, canalicular membranes of hepatocytes, kid-  
128 ney cells, the placenta barrier and endothelial cells of the  
129 brain membrane [12]. P-gp plays a crucial role in the  
130 absorption, distribution and elimination of a variety of  
131 drugs [13]. In the brain, P-gp prevents the drug molecules  
132 from entering through the blood-brain barrier (BBB) into  
133 the central nervous system [14]. In the intestines, P-gp  
134 pumps cytotoxic drugs out of the cells and into the lumen  
135 and reduces the drugs' intracellular concentration and  
136 toxicity. Thus, P-gp limits the BA of orally administered  
137 drugs.

138 Hence, P-gp is considered to act as an absorptive bar-  
139 rier for orally administered drugs and drug efflux, by  
140 means of membrane proteins, has become an issue. Com-  
141 pounds which can inhibit the P-gp efflux of drugs are  
142 important because they can improve the drug BA due  
143 to better absorption through the intestines and reduce  
144 MDR [15, 16]. P-gp is highly expressed in the lower small  
145 intestine [17] and the expression level of P-gp is 2.31-fold  
146 higher in the ileum than that in the jejunum [18]. Inhibi-  
147 tion of P-gp activity may be an effective way to enhance  
148 the oral drug BA. Since the late 1980s, scientists have been  
149 interested in designing specific P-gp blockers to admin-  
150 ister together with anticancer drugs in order to enhance  
151 the anti-cancer drugs' therapeutic effect [19, 20]. Rhoda-  
152 mine-123 (Rho-123) [21], a cationic, lipophilic fluor-  
153 ochrome, which accumulates rapidly in cells, preferen-  
154 tially in the mitochondria membranes of living cells, is  
155 a tool that has been vital for the investigation of MDR  
156 phenotypes in previous studies [22–25]. This dye is trans-  
157 ported out of cells by P-gp and indicates P-gp pumping.  
158 Studies have shown that a P-gp blocker can change ■the  
159 pumping ability of P-gp ■author:ok?■, increase the Rho-  
160 123 uptake, soar cellular accumulation of Rho-123 and  
161 ascend Rho-123 fluorescent light from lysed Caco-2 cells  
162 [26]. According to recent research a number of excip-  
163 ients/ surfactants commonly used in pharmaceutical for-  
164 mulations may disrupt the efflux caused by P-gp and lead  
165 to an increase in drug BA. Vitamin E-TPGS (d- $\alpha$ - tocoph-  
166 erolpolyethylene glycol 1 000 succinate) is a P-gp inhibitor  
167 example that increases the absorption flux of amprenavir  
168 [27, 28]. As such, „inactivity” of excipients and the idea  
169 supporting „excipients are inert” has been reevaluated  
170 [29]. Surfactants are ■a common class of excipients  
171 ■author: rephrasing ok?■. They are categorized in two  
172 groups: ionic and nonionic. Tween surfactants are poly-  
173 sorbate molecules, each containing ethylene glycol (oligo)  
174 (OEG) head groups (hydrophilic) and an alkyl tail (hydro-  
175 phobic) ■[29]■author:please correct reference  
176 number■. They consist of a mixture of different mole-  
177 cules rather than a single molecule. Tween excipients are  
178 used as emulsifying agents, solubilizing agents, wetting  
179 agents and dispersing/suspending agents in pharmaceu-  
180 tical formulations [30].

181 The Caco-2 cell line, ■which is representative for  
182 human carcinoma colorectal cells ■author: rephrasing  
183 ok?■, is widely used for *in vitro* studies and has been used  
184 as a model for estimating drug permeability and the abil-  
185 ity of different substrates for P-gp inhibition since the  
186 1980s [31, 32]. Growing onto trans-well polycarbonate

187 membranes, cells undergo differentiation and express ef-  
188 flux transporters (e.g., P-gp) [33,34]. In this paper, we have  
189 characterized the effects of Tween excipients (Tween 20,  
190 Tween 40, Tween 80) on the activity and expression of P-  
191 gp.  
192  
193

## 2. Materials and methods

---

### 2.1. Materials

196 Tween excipients and Dimethylsulfoxide (DMSO) were  
197 purchased from Merck, Germany. Rhodamine 123 was  
198 bought from Sigma, USA. Anti  $\beta$ -actin Antibody was sup-  
199 plied by GE, USA. X-ray film was purchased from Xoe,  
200 USA. Fetal Bovine Serum (FBS) and Trypsin were ob-  
201 tained from Gibco, Invitrogen, USA. Human carcinoma  
202 colorectal Caco-2 cell line was provided by the National  
203 cell bank of Iran, Pastur institute. All cell culture disposa-  
204 ble equipment was provided by Orange, Belgium. The  
205 total protein assay kit was obtained from Pars Azmoon,  
206 Iran. RPMI 1640 – Powdered Cell Culture Medium was a  
207 product of PAA Co, Austria and Trypan blue was pur-  
208 chased from Biosera, France.  
209  
210

### 2.2 Methods

#### 2.2.1 Cell culture procedures

211 All operations were carried out using standard sterile  
212 conditions under a laminar flow cabinet. The cabinets  
213 were routinely sterilized by exposure to ultra-violet radial  
214 ion and then washed in 70 % alcohol prior to use. Caco-2  
215 cells were routinely maintained in culture dishes (T75  
216 falkons, Orange, Belgium) at 37°C in 5 % CO<sub>2</sub> atmos-  
217 phere, using RPMI-1640 supplemented with 10 % FBS,  
218 1 % sodium pyruvate, 1 % non-essential amino acids  
219 and 1 % L-alanine-glutamine 200 mM. The medium was  
220 exchanged every other day and cells were detached after  
221 reaching 90 % confluency washing with PBS, detached with  
222 0.25 % trypsin and 0.02 % EDTA.  
223  
224  
225  
226

#### 2.2.2 MTT test assay

227 Cells were trypsinized and centrifuged at 1000 rpm for  
228 5 min. After resuspending, the cells were counted and  
229 diluted to receive 15000 cells in 200  $\mu$ L in each well. 200  $\mu$ L  
230 of cell suspension was added to each well except those  
231 within the last column. Fresh medium was added to the  
232 last column to maintain humidity and prevent an „edge  
233 effect”. The well-plate was put into an incubator over-  
234 night. On the following day, series of dilutions of Tween  
235 excipients were prepared and the medium of columns 2  
236 to 11 was removed and cells were seeded with different  
237 dilutions of excipients (triplicate). Fresh medium was  
238 added to column 1 (control). Cells were incubated for  
239 24 h and on day 3 of the experiment, media were removed  
240 from wells and cells were washed with PBS (phosphate  
241 buffered saline); then 50  $\mu$ L of MTT solution (2 mg/mL)  
242 were added and incubated for 4 h. MTT solution was  
243 removed and MTT-formazan crystals were dissolved in  
244 200  $\mu$ L DMSO and 25  $\mu$ L Sorensen buffer. The absorbance  
245 rate was recorded at 570 nm and the cell viability per-  
246 centage was calculated [35].  
247  
248

249 **2.2.3 Assessing the uptake of Rhodamine-123**

250 For the uptake studies, Caco-2 cells were seeded into 24-  
251 well plates and left for 24 h. On the following day, the old  
252 medium was removed and cells were washed with PBS.  
253 Then new culture media containing different concentra-  
254 tions of excipients and 0.3 mM verapamil, as P-gp inhibitor  
255 measurements:  $\mu\text{M}$ ? unify verapamil, as P-gp inhibitor  
256 [36], were added and left for another 24 hours. On day 3 of  
257 the experiment, the old medium was removed and cells  
258 were washed three times with PBS and Rho-123 solution  
259 (RPMI containing 10 mM HEPES (pH=7.4) and 5  $\mu\text{M}$   
260 Rho-123) were added and incubated in 37°C for 3 h. After  
261 the incubation period, Rho-123 solution was removed and  
262 cells were washed three times with ice-cold PBS. Cells  
263 were lysed in 1 % Triton X-100 and centrifuged in  
264 1000 rpm for 5 min. Supernatant was used to measure  
265 the fluorescence and total protein content. The quantity  
266 of Rho-123 was calculated. Then cellular Rho-123 accu-  
267 mulation was normalized to the total protein content  
268 determined by protein the assay kit [37].  
269

270 **2.2.4 Western blotting**

271 Cells were moved to a 6-well plate in the density of  $10^6$   
272 cells per well and treated for 24 h with the culture me-  
273 dium (control) or a culture medium containing Tween 20  
274 (0.01 %, 0.001 % (w/v)), Tween 40 (0.05 %, 0.01 % (w/v)) or  
275 Tween 80 (0.01 %, 0.001 % (w/v)). Solutions were removed  
276 and cells were washed with PBS, then incubated in 37°C  
277 for 5 min with Trypsin/EDTA 0.25 %. The supernatant  
278 was removed and cell sediment was washed twice with  
279 PBS. Lysis buffer (Triton X-100 50 mM, Tris-HCl, pH=7.4,  
280 NaCl 150 mM, EDTA 5 mM, 1 % protease inhibitor cock-  
281 tail) was added and cell suspension was centrifuged in  
282 15000 rpm for 5 min. The proteins were separated by  
283 electrophoresis through SDS-polyacrylamide gel on  
284 12.5 % running gel and 4 % stacking gel at 80 V for  
285 120 min. The gel was electro blotted to a Polyvinylidene  
286 difluoride (PVDF) membrane using semi-dry Western  
287 blotting; 3 % dried skim milk was used to block the mem-  
288 brane for 1 h at room temperature and the membrane  
289 was washed 3 times with PBS and 0.1 % Tween 20 (PBS-T)  
290 and then incubated overnight with a primary monoclonal  
291 antibody (Anti- $\beta$ -actin), diluted 1/1000 in PBS-T. After  
292 washing with PBS-T, the membrane was incubated with  
293 horseradish peroxidase-conjugated rabbit anti-mouse  
294 secondary antibodies for 2 h. Membrane was washed  
295 and solution A and B of the Enhanced Chemilumines-  
296 cence (ECL) kit were added. After that the membrane was  
297 exposed to X-ray film. The membrane was washed twice  
298 and incubated with a MDRI antibody (C219) overnight.  
299 After washing, the membrane was put into horseradish  
300 peroxidase-conjugated rabbit anti-mouse secondary an-  
301 tibodies for 2 h. The membrane was washed and then  
302 solution A and B of ECL kit were added, after which the  
303 membrane was exposed to X-ray film. author: This  
304 paragraph is double, is the procedure actually done twice?  
305 If so I would add "again". Please check!

### 3. Results and discussion

---

311  
312  
313 The cytotoxicity of excipients on cells was evaluated  
314 using an MTT test assay. The MTT test assay of the  
315 excipients indicated the proper concentration of excip-  
316 ients which were used in Western blotting and uptake of  
317 Rho-123 in the following steps. ■The optical density (OD)  
318 value obtained from the ELISA reader was divided to that  
319 of the control samples ■author: ok?■ and cell viability  
320 for each excipient was calculated after 24 h exposure to  
321 different concentrations. Two maximum nontoxic con-  
322 centrations were selected for Western blotting and the  
323 Rho-123 uptake test. According to the results, cell viability  
324 was significantly decreased after the treatment with con-  
325 centrations of 0.05 % to 4 % (w/v) of Tween 80 and Tween  
326 20, but treatment with 0.05 % (w/v) Tween 40 showed no  
327 toxicity (Fig. 1).

328 ■Fig. 1■

329 To investigate the functional activity of P-gp, Caco-2  
330 cells were incubated in 48-well plates with different con-  
331 centrations of excipients for 24 h, then cells were washed  
332 with PBS and exposed to Rho-123 (5  $\mu$ M) for 3 h. Cells  
333 were lysed and the accumulated Rho-123 in cells was  
334 measured (excitation at 485 nm and emission measured  
335 at 530 nm) for each sample. The protein content of the  
336 aliquots was measured with the protein assay kit and the  
337 cellular Rho-123 accumulation was normalized with re-  
338 spect to the total protein in each well (Fig. 2). Photos  
339 taken with the immunofluorescence microscope, (Fig. 3),  
340 showed an increase in Rho-123 uptake to cells which had  
341 been treated with Tween 40 (0.05 % w/v).

342 ■Fig. 2■

343 ■Fig. 3■

344 The P-gp expression was measured in Caco-2 cells  
345 which were treated for 24 h with excipients and compared  
346 to that of the control samples. The protein was separated  
347 by electrophoresis on 12.5 % running gel and 4 % stacking  
348 gel. Electrophoretic transfer of separated proteins in gel  
349 was transferred to a PVDF membrane using semi-dry  
350 blotting. The membrane was blocked in PBS-T and 3 %  
351 dried skim milk at room temperature for 1 h and washed  
352 three times for 15 min in PBS-T. Encountering primary  
353 and secondary antibodies, the bands were visualized  
354 using ECL Western blotting detection reagents and ex-  
355 posed to an X-ray film (Fig. 4).

356 ■Fig. 4■

357 For orally administered drugs, membrane efflux pro-  
358 teins located in intestinal cells are challenges reducing  
359 drug bioavailability. The findings of this study proved that  
360 there are some excipients which could down regulate the  
361 MDR1 gene expression and the P-gp protein expression  
362 leading to improvement in drug bioavailability. The  
363 present study, characterizes the effects of excipients on  
364 the P-gp expression and the activity in the Caco-2 mono-  
365 layer. Western blotting confirms the Rho-123 uptake data.  
366 Those excipients which were able to increase the Rho-123  
367 accumulation showed decrease in P-gp expression as  
368 well. ■author:ok?■ This study aimed to access a rational  
369 drug formulation development strategy for oral dosage  
370 forms based on the Caco-2 monolayer as an *in vitro*  
371 screening model.

372

373 The results showed that Tween 20 and Tween 40 are  
374 able to inhibit the P-gp efflux pump, as indicated by an  
375 increase in the Rho-123 accumulation and confirmed by  
376 lightening in the P-gp band according to the Western  
377 blotting.

378 MDR proteins, belonging to ABC transporters, are  
379 membrane transport proteins which detoxify cells from  
380 external substrates. These proteins are known to limit  
381 absorption through biological membranes such as intestinal,  
382 brain and cancer cells [38]. Some ABC transporters  
383 seem relatively specific to their endogenous substrates  
384 while others such as P-gp, exhibit a broad substrate spectrum  
385 [39]. Ligand-based approaches have demonstrated  
386 that P-gp substrates and inhibitors are hydrophobic, partitioning  
387 into membrane, and many of them have net positive charge  
388 [40] containing hydrogen bond acceptors [40,41].

390 Knowing P-gp substrates may have advantages  
391 whether for finding blockers to enhance drug BA and  
392 prevent resistant to anti chemotherapies or for using a  
393 P-gp inducer to slow the progression of the Alzheimer's  
394 disease [42]. Using equilibrium and kinetic radioligand  
395 binding, at least 4 sites are suggested for P-gp to interact  
396 with substrates. While sites 1, 2 and 3 are known to be in  
397 relation with transport activities and interact with Rho-  
398 123, vinblastin and paclitaxel, site 4 is believed to be a  
399 regulatory site and modulators could interact with it  
400 which prevents substrates from binding to P-gp and results  
401 in P-gp inhibition [43]. The choice of an experimental  
402 method is a concern in P-gp studies. Data from different  
403 labs may also have significant differences [44]. For instance,  
404 midazolam has been realized as non-substrate, an inhibitor  
405 and a substrate in three different studies. Same as Midazolam,  
406 Doxorubicin has been identified both a substrate and a non-substrate  
407 [45]. A report claims that Tween 80 decreased the ratio of the  
408 serosal-mucosal transport to the mucosal-serosal transport of  
409 Rho-123 across the rat jejunal membrane *in vitro* and the Caco-2  
410 cell monolayer suggestive of P-gp inhibition [46]. In addition,  
411 the *in vitro* absorption of digoxin across an everted  
412 rat gut sac (a P-gp substrate) was increased after the  
413 treatment with Tween 20 (0.5 % w/v) and Tween 80 [47].  
414 Co-administration of digoxin with Tween excipients  
415 showed an increase in AUC and  $C_{max}$  in rats while Tween  
416 80 was not able to increase the Rho-123 uptake and  
417 Western blotting bands were not lightened when treated  
418 with concentrations 0.01 % (w/v) and 0.001 % (w/v) of  
419 Tween 80 either [48]. It should be considered that the  
420 concentrations used in this study were less than those  
421 of mentioned studies as further concentrations were toxic  
422 to cells according to the MTT results.

424 Although usage of Caco-2 cells is common for P-gp  
425 studies[49], P-gp expression in this cells is depended on  
426 the time [50], culture conditions [49], passage number  
427 and also passage procedure [49]. Therefore variable expression  
428 levels must be taken into account and a theory says that  
429 Caco-2 cells even over express P-gp [51]. A Western analysis  
430 on Caco-2 cells showed P-gp to be expressed earlier than day 7,  
431 but verapamil transport study proved that it may not be fully  
432 functional until day 17 [52].

433 In this study, Tween 20 and Tween 40 at concentration  
434 of 0.01 % (w/v) and 0.05 % (w/v), respectively, were se-

435 lected to be evaluated in the Rho-123 accumulation assay.  
436 Both excipients increased the Rho-123 uptake by 200 %.  
437 Western blotting results confirmed the Rho-123 uptake  
438 findings.

439 Several studies have conducted to investigate the  
440 mechanism of inhibition of P-gp by surfactants. Such  
441 inhibition of P-gp activity *in vivo* could cause drug-drug  
442 interactions, alter the pharmacokinetic profiles of drugs  
443 that are P-gp substrates and increase/decrease toxicity.  
444 Although the results presented in this study suggest that  
445 Tween 20 and Tween 40 are able to inhibit P-gp both  
446 activity and expression *in vitro*, the possible mechanism  
447 of P-gp inhibition through excipients is, at present, un-  
448 known.

449 Taken together, some factors such as P-gp structure, P-  
450 gp environment and substrate partitioning into these  
451 tissues should be understood fully to judge the ability  
452 of these commonly used excipients to inhibit P-gp activity  
453 *in vitro* and to further characterize the effect of commonly  
454 used excipients on both activity and expression of P-gp.  
455 There should be more data generated on the structure of  
456 each binding site, which would then ultimately lead to  
457 explain the variability in data and also gives models for  
458 each binding site. Additional experiments e.g. gut perfu-  
459 sion studies in rats, pharmacokinetic studies in animals  
460 or more specific assays i.e. assays which target specific  
461 binding sites on protein, should be carried out to examine  
462 the effects of these commonly used excipients *in vivo* and  
463 enable us to build more specific models.

---

#### 4. Conclusion

---

466  
467  
468 In this study, Tween 20 (0.01 % w/v) and Tween 40 (0.05 %  
469 w/v) had significant inhibitory effects on either the activ-  
470 ity or the expression of P-gp. Therefore, the usage of  
471 Tween 20 and Tween 40 in above mentioned concentra-  
472 tions may be a reasonable formulating approach to in-  
473 crease drug bioavailability.

#### Acknowledgements

475  
476 The authors would like to thank the authorities of the  
477 Drug Applied Research Center, Tabriz University of Med-  
478 ical Sciences, for their financial support.

---

#### Conflict of Interest

---

482  
483 The authors report no conflict of interests in the present  
484 study.
